

How to Create and Design a Personal Website

The following steps explain how to create a simple personal website using **W3Schools**, **HTML**, and **InfinityFree**.

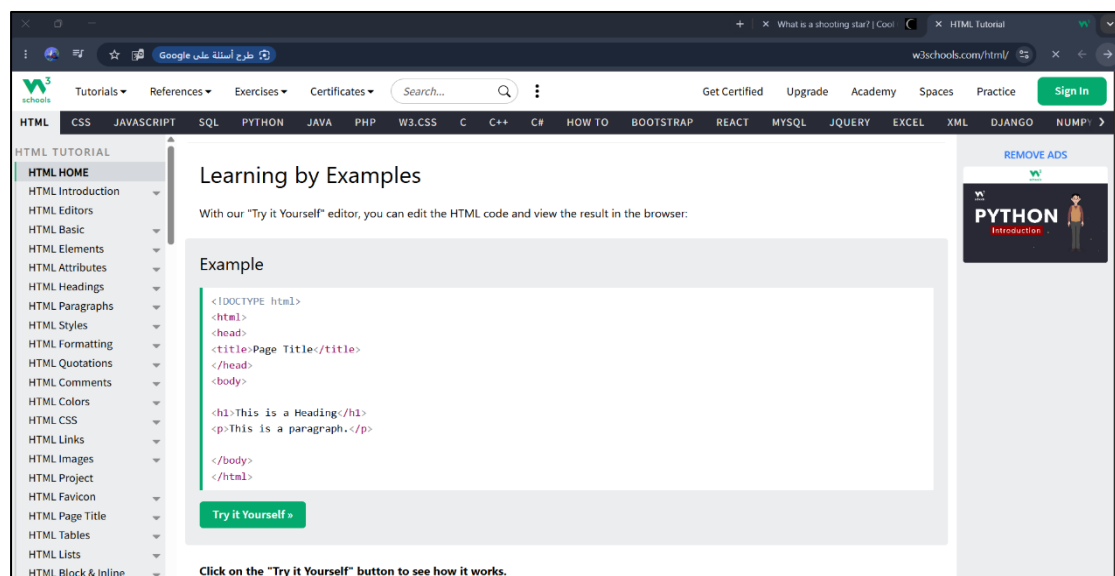

Step 1: Open W3Schools

First, open the **W3Schools** website.

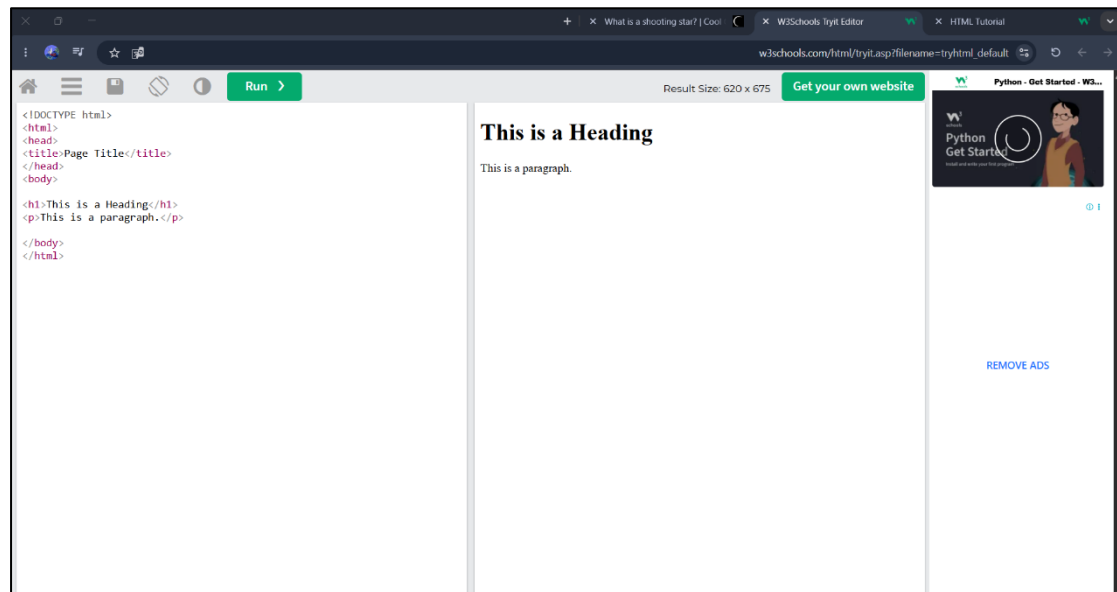

Step 2: Try the Example Code

Click on the “Try it Yourself” button.

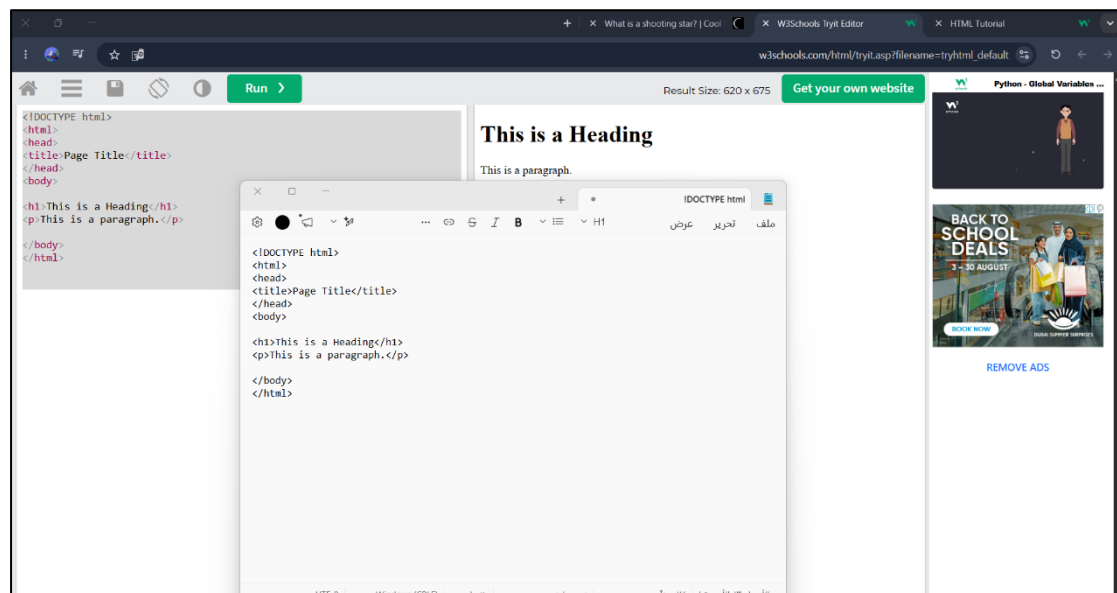

Step 3: Understand the Basic HTML Code

You will see a simple HTML code that demonstrates how to create a basic website and how the output will look.

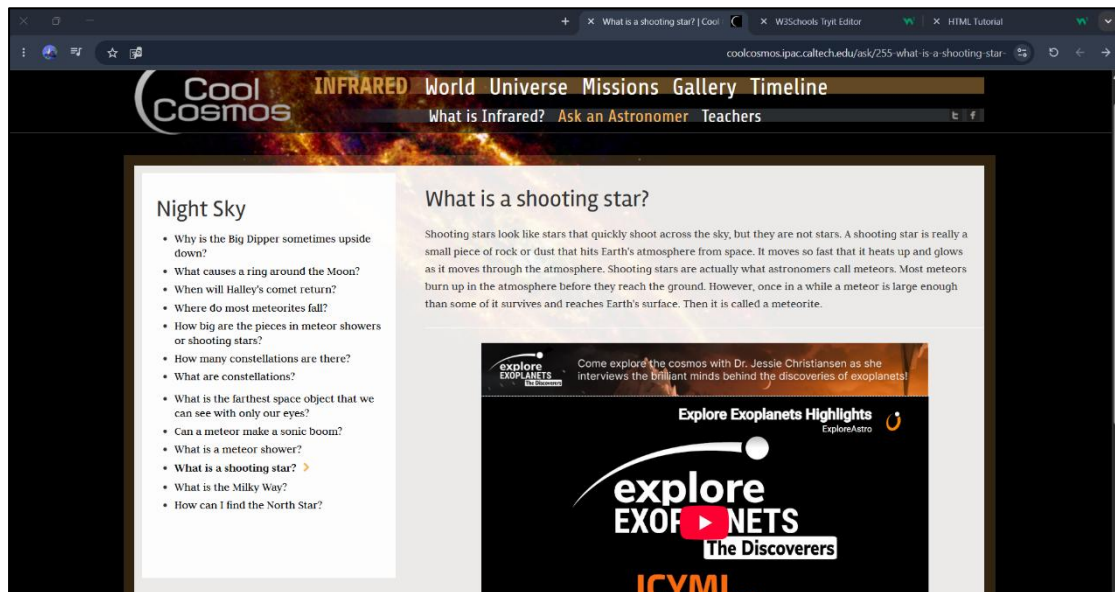

Step 4: Copy the Code

Copy the example code and paste it into a text editor on your computer, such as **Notepad**.

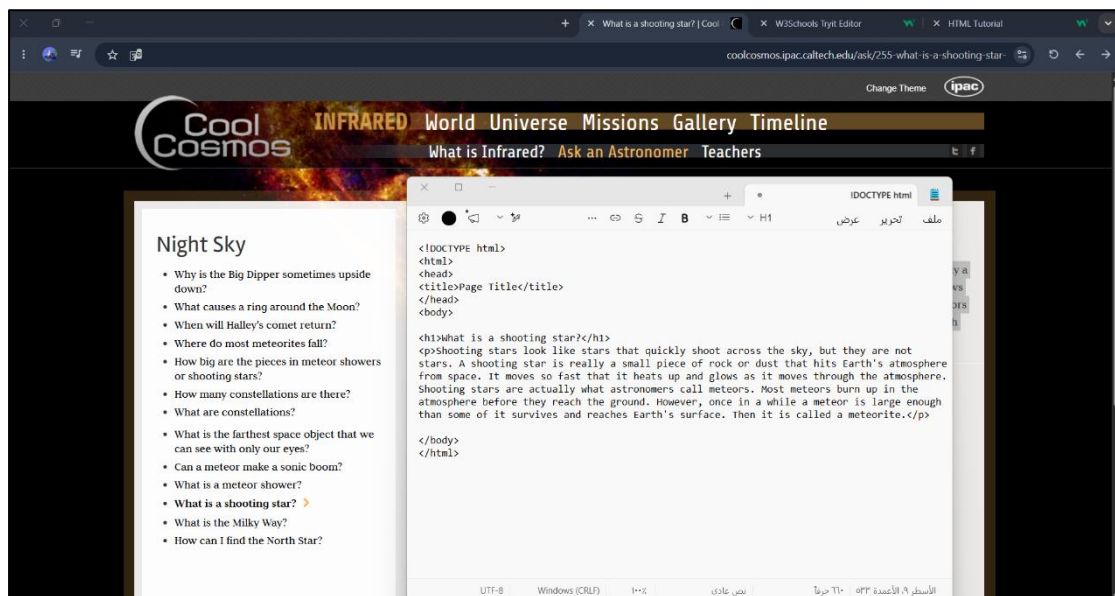

Step 5: Add a Paragraph

Try writing any paragraph you would like to display on your website. For this tutorial, I chose a website as a source of information.

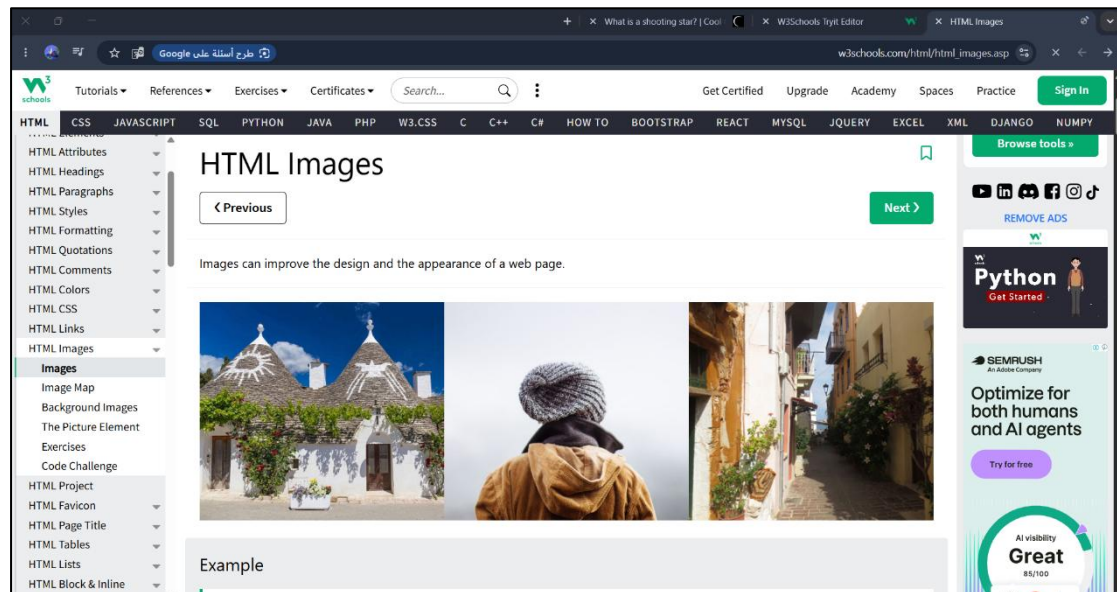

Step 6: Add the Information

Copy the information you want to use and paste it into your HTML code.

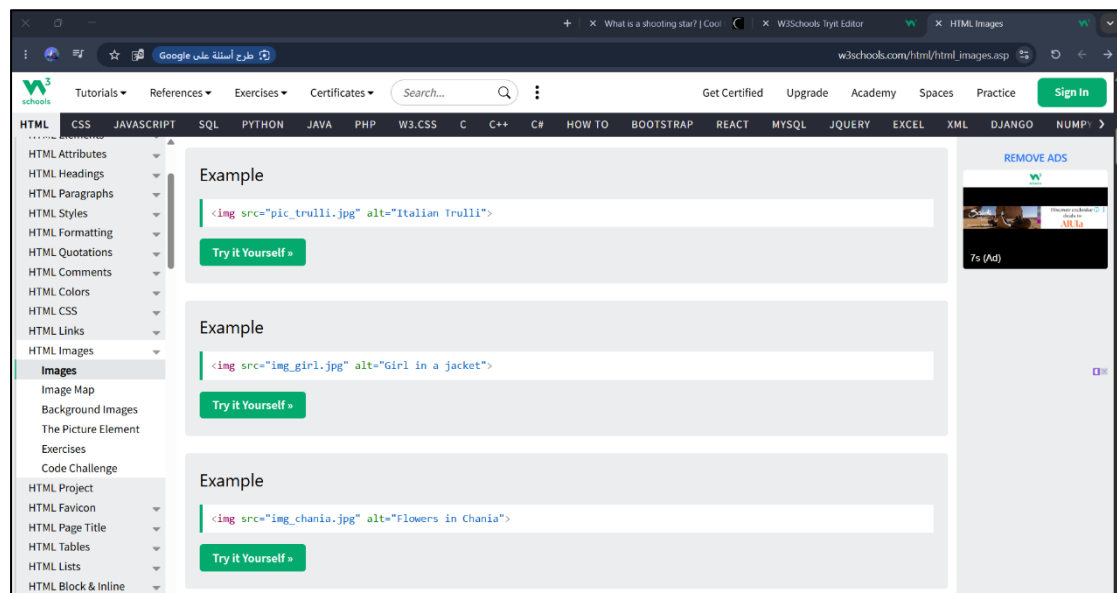

Step 7: Add an Image

Go back to W3Schools and select **“HTML Images.”** A new page will appear with information and examples about adding images to an HTML website.

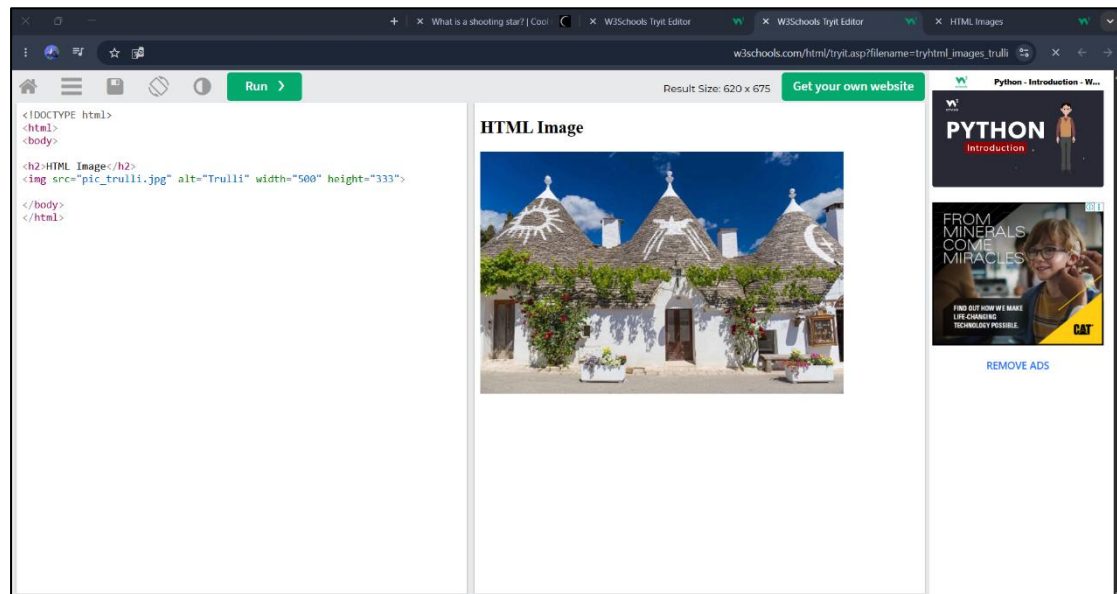

Step 8: Try the Image Example

Click on the **“Try it Yourself”** button under one of the examples.

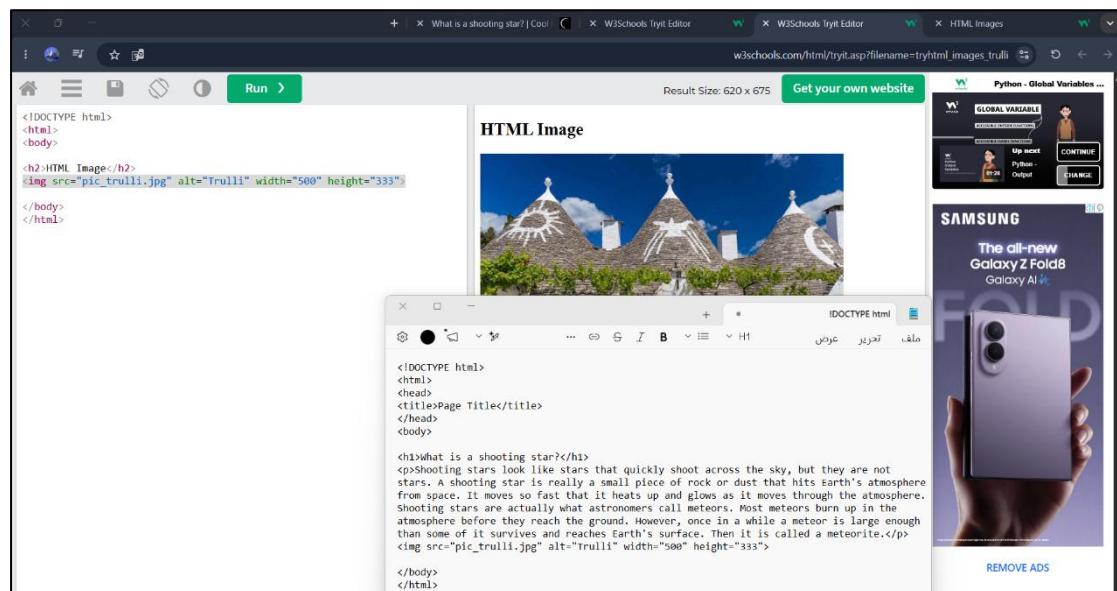

Step 9: View the Image Code

You will see a simple HTML code showing how to add an image to a website and how the final output will look.

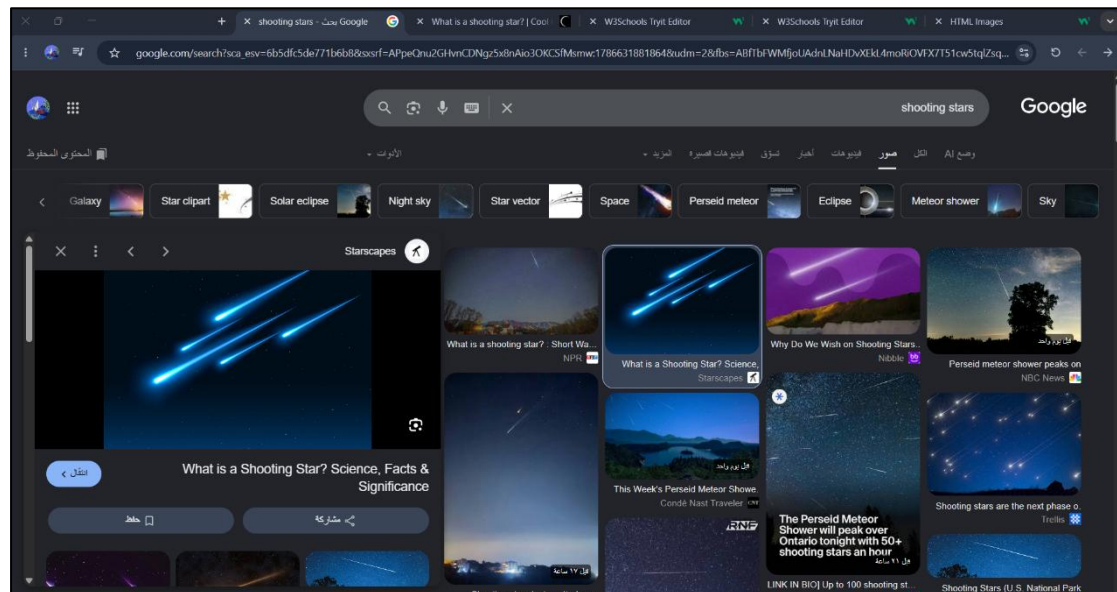

Step 10: Copy the Image Code

Copy the example code and paste it into your HTML file in Notepad.

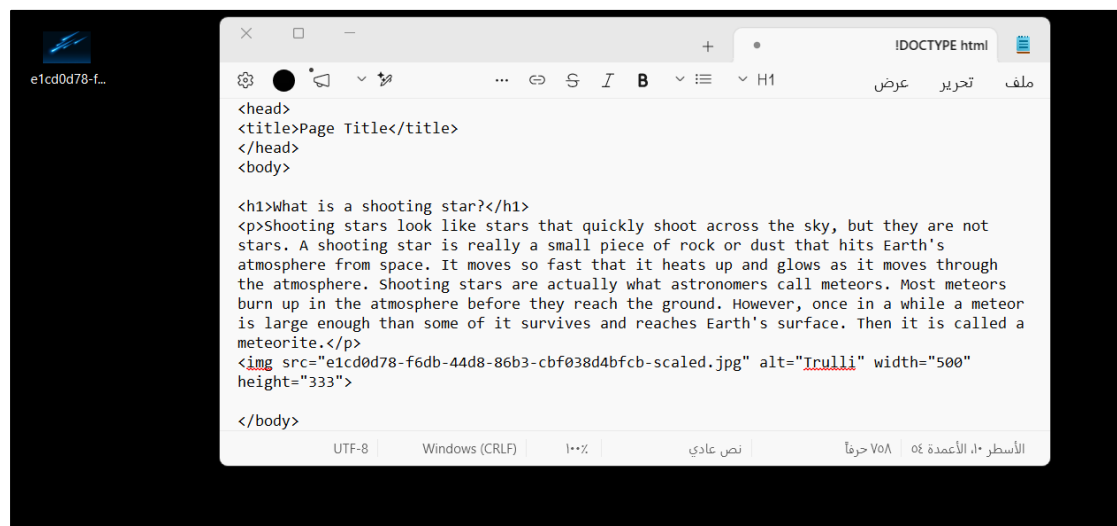

Step 11: Choose an Image

Choose an image from any source. In this tutorial, I selected an image from Google and downloaded it to my computer.

Step 12: Add the Image to the Code

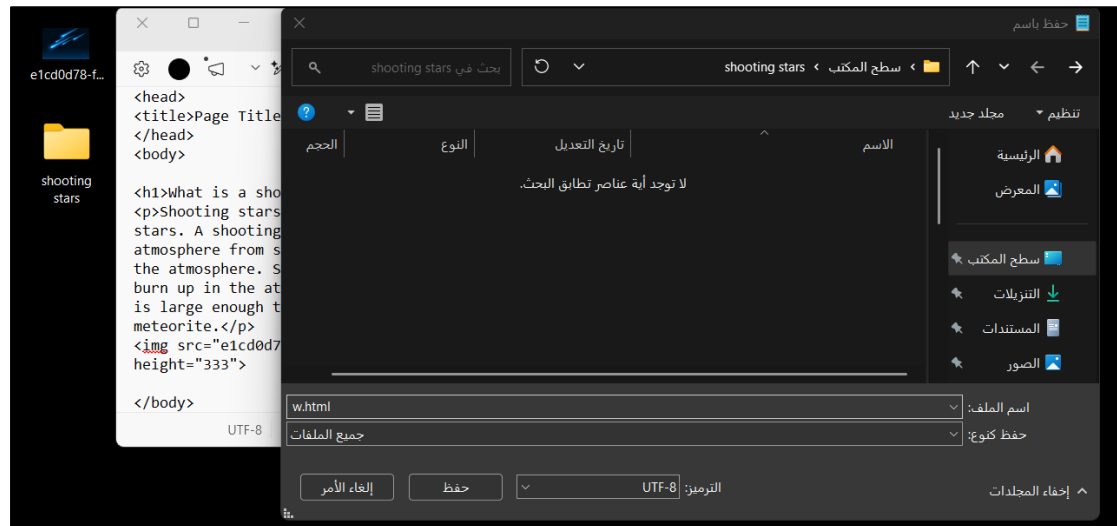

Copy the **image name** or **file path** and add it to the appropriate line in your HTML code. This tells the website where to find and display the image.

Step 13: Save the HTML File

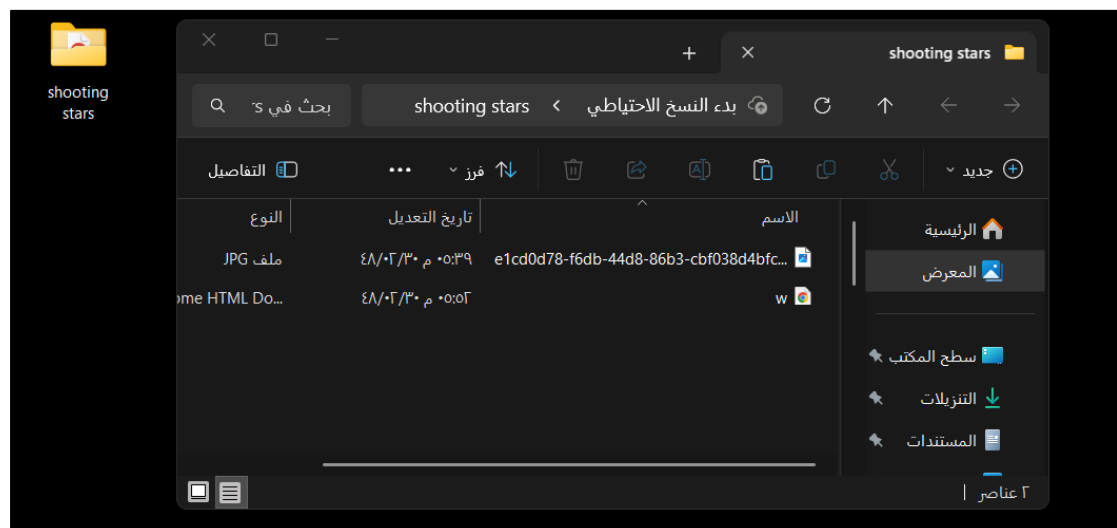

Create a new folder on your computer and save the Notepad file as an **HTML document**.

Note: When saving the file, make sure to select **“All Files”** instead of saving it as a text document. Also, make sure the file ends with **.html**.

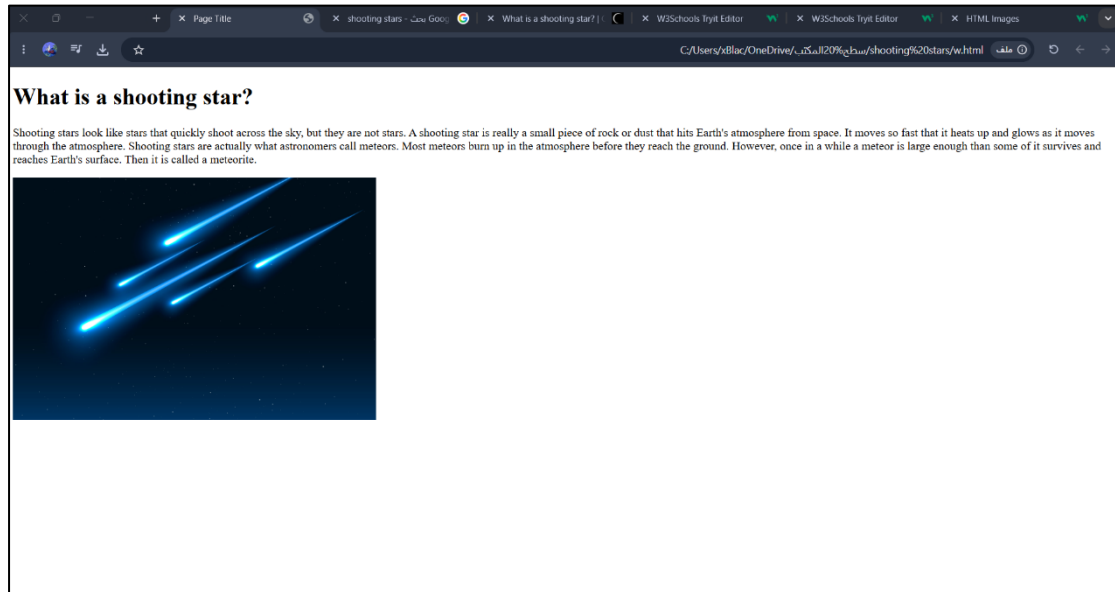

Step 14: Organize the Files

After saving the HTML file, place the downloaded image inside the **same folder** as the HTML file. This is important because the HTML code needs to be able to find the image.

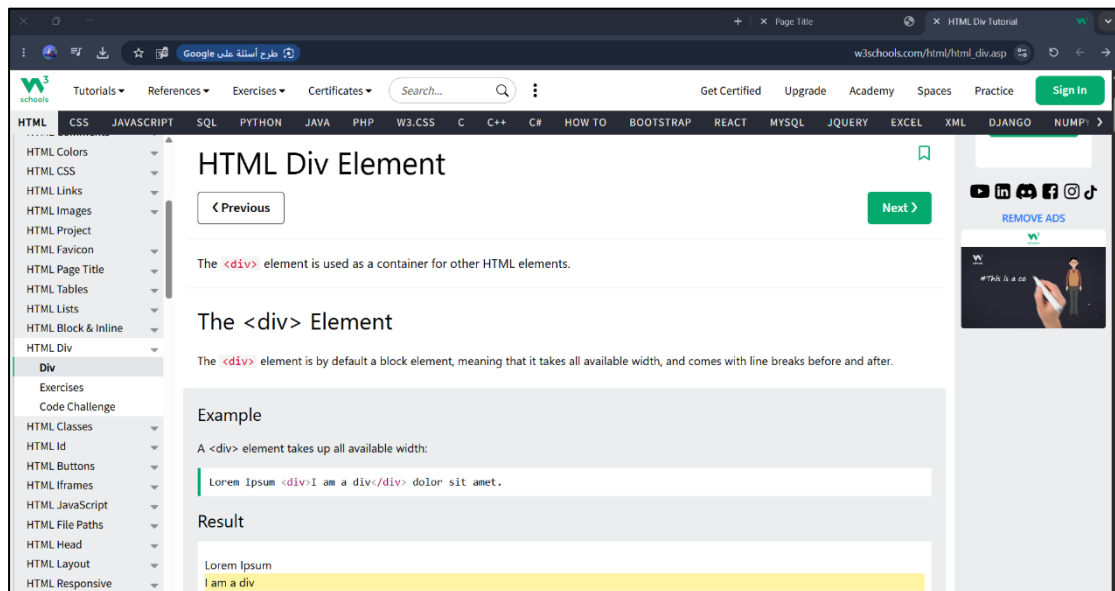

Step 15: Open the Website

Open the HTML file in a web browser to see how your website looks.

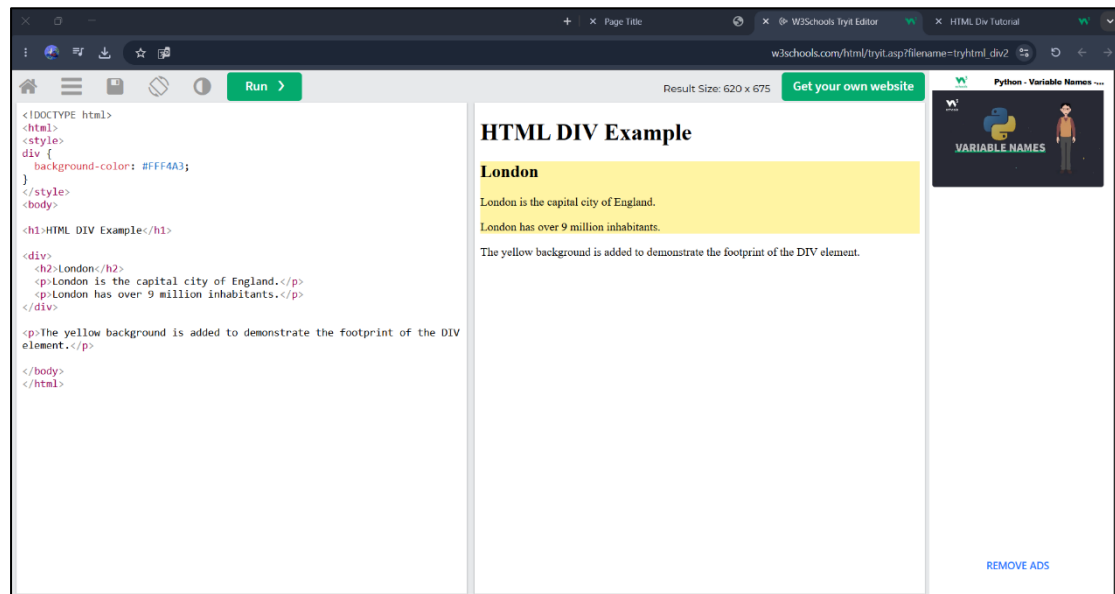

Step 16: Add a Div Element

Go back to W3Schools and select “HTML Div.” Then, click on the “Try it Yourself” button under one of the examples.

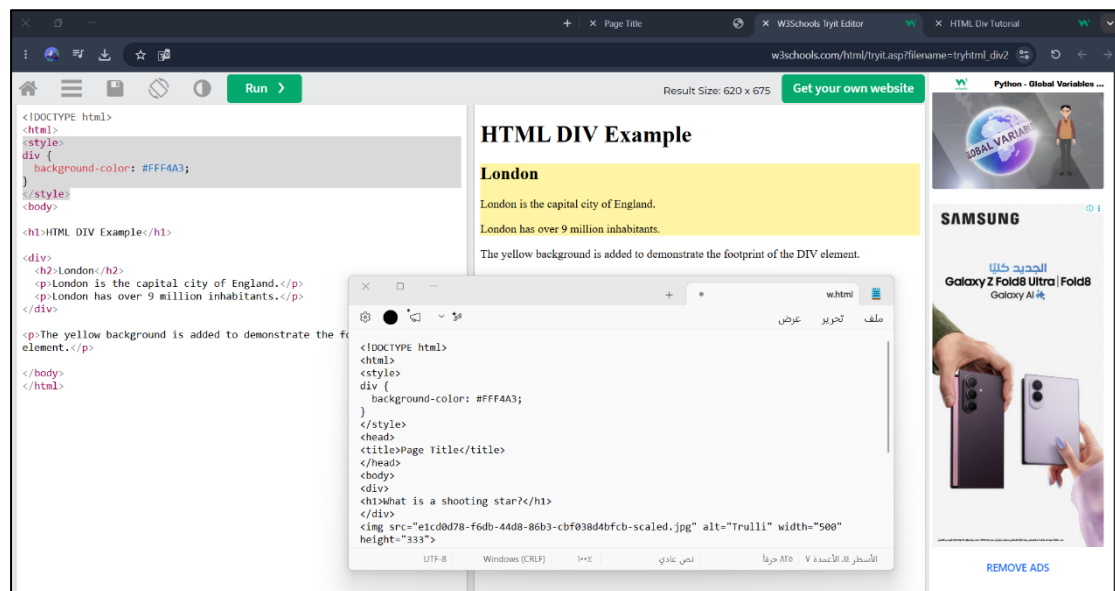

Step 17: Understand the Div Example

You will see a simple HTML example demonstrating how to use a <div> element to create a section with a highlighted background behind the text.

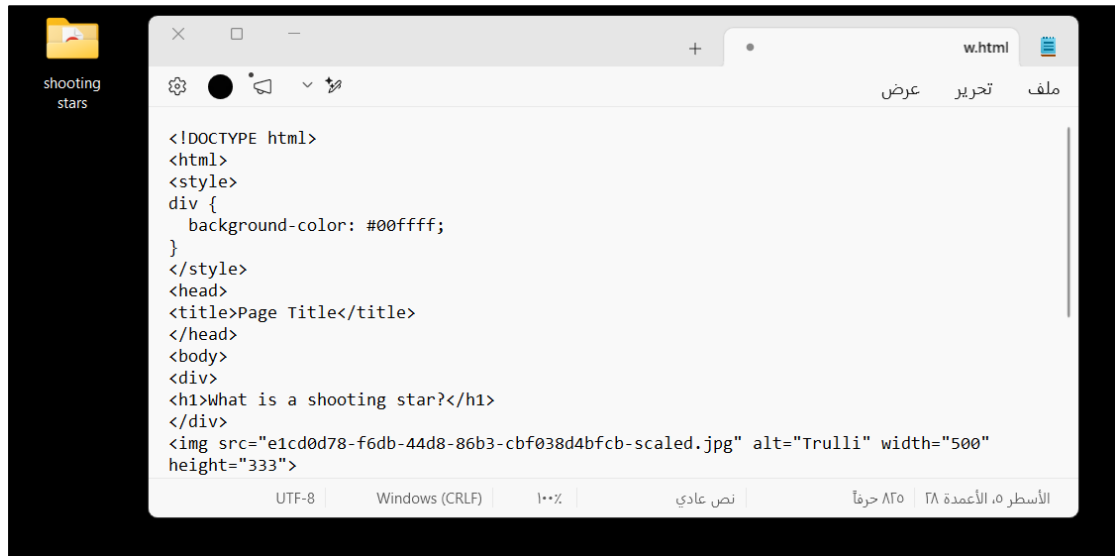

Step 18: Copy the Code

Copy the example code and paste it into your HTML file in Notepad.

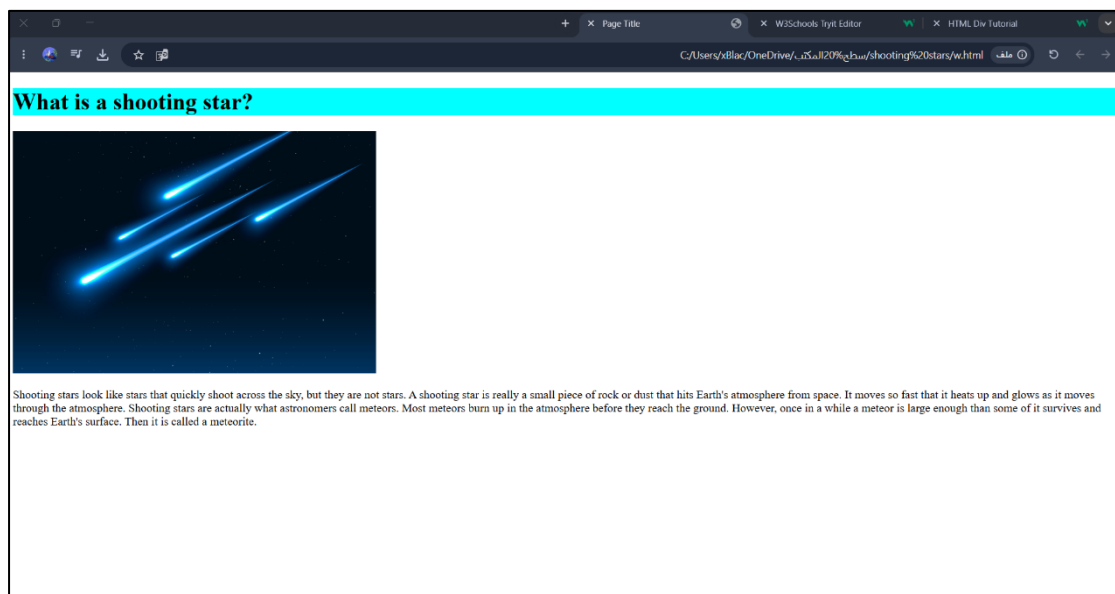

Step 19: Change the Background Color

Change the background color to any color you prefer. In this tutorial, we added HTML code to make the background **light blue**.

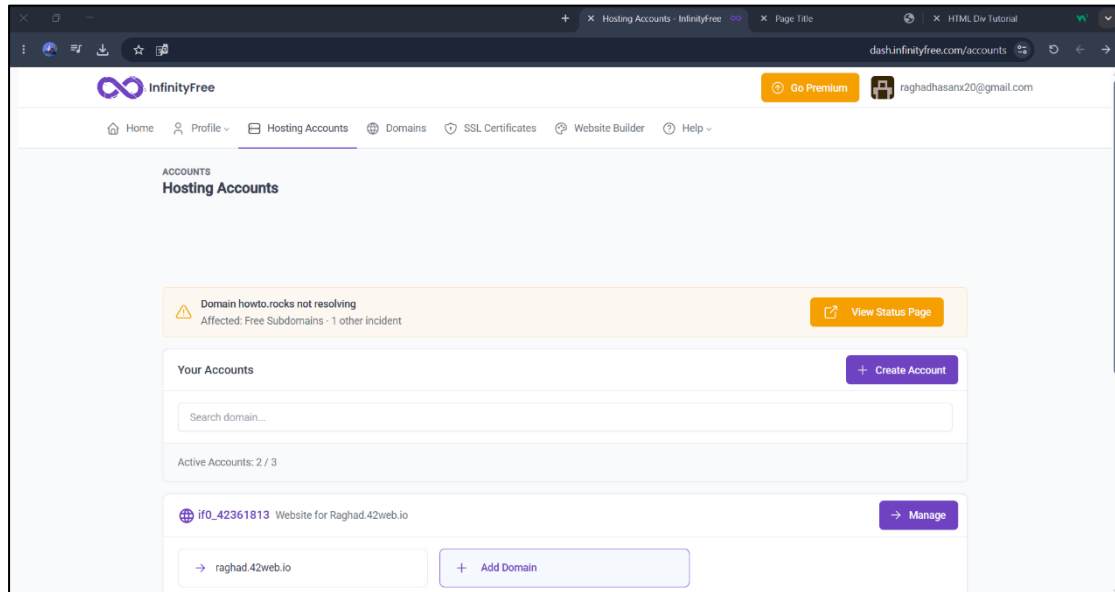

Step 20: View the Updated Website

After making these changes, open the HTML file again to see the updated appearance of your website.

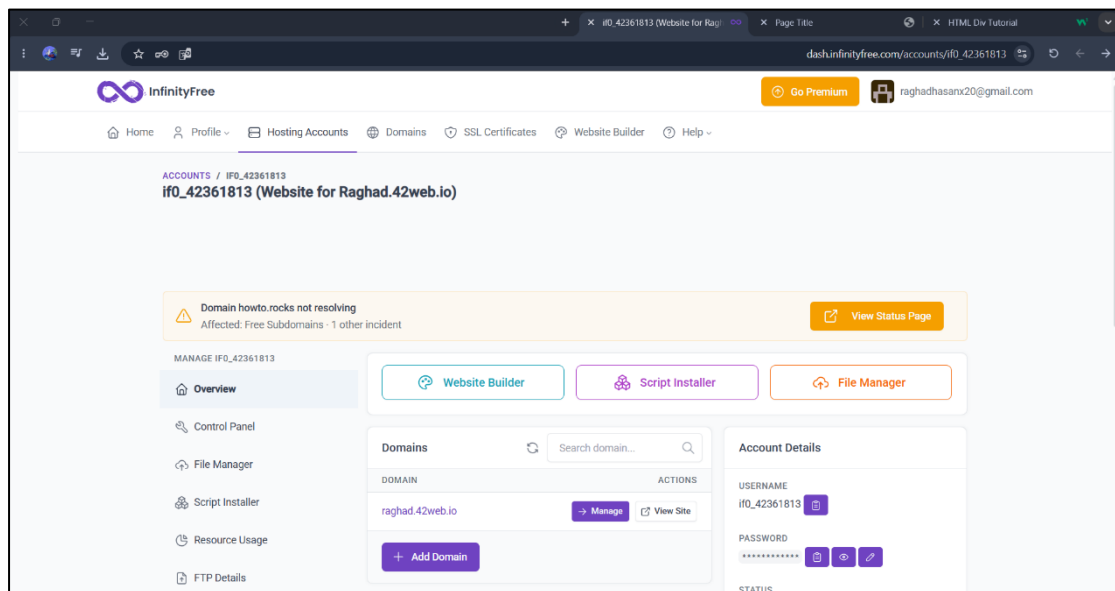

Step 21: Open InfinityFree

Next, go to the **InfinityFree** website.

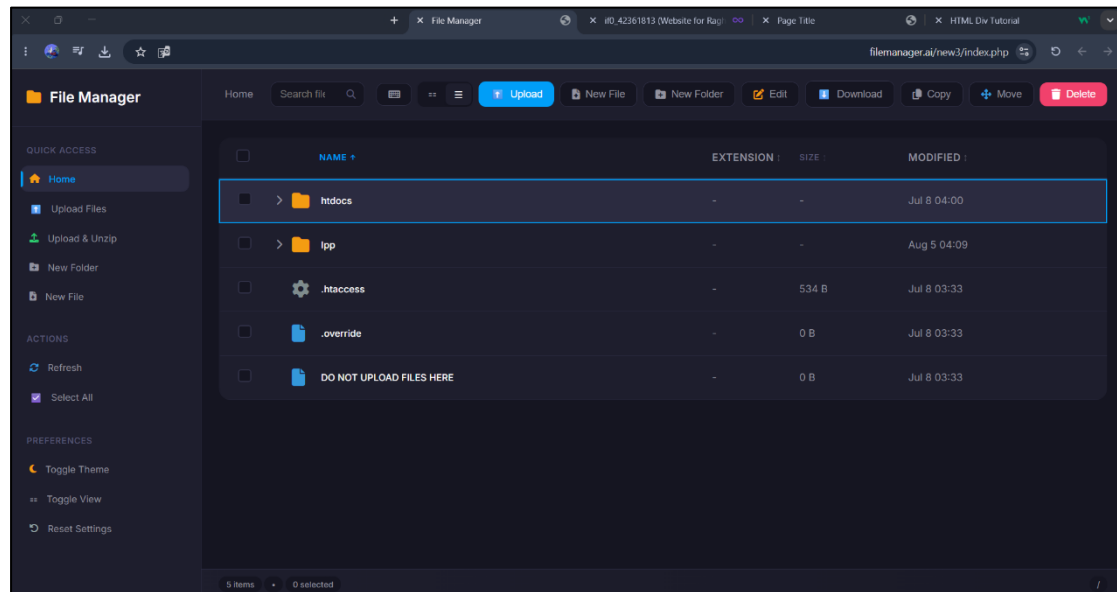

Step 22: Open the File Manager

After logging in to your InfinityFree account, go to the **File Manager**.

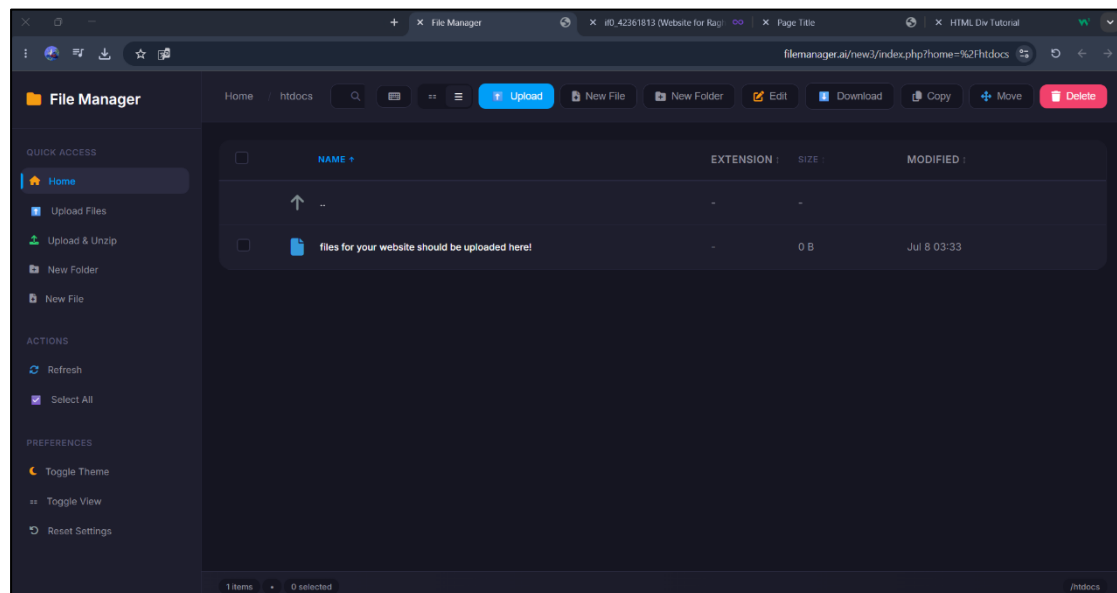

Step 23: Open the htdocs Folder

Inside the File Manager, open the **htdocs** folder.

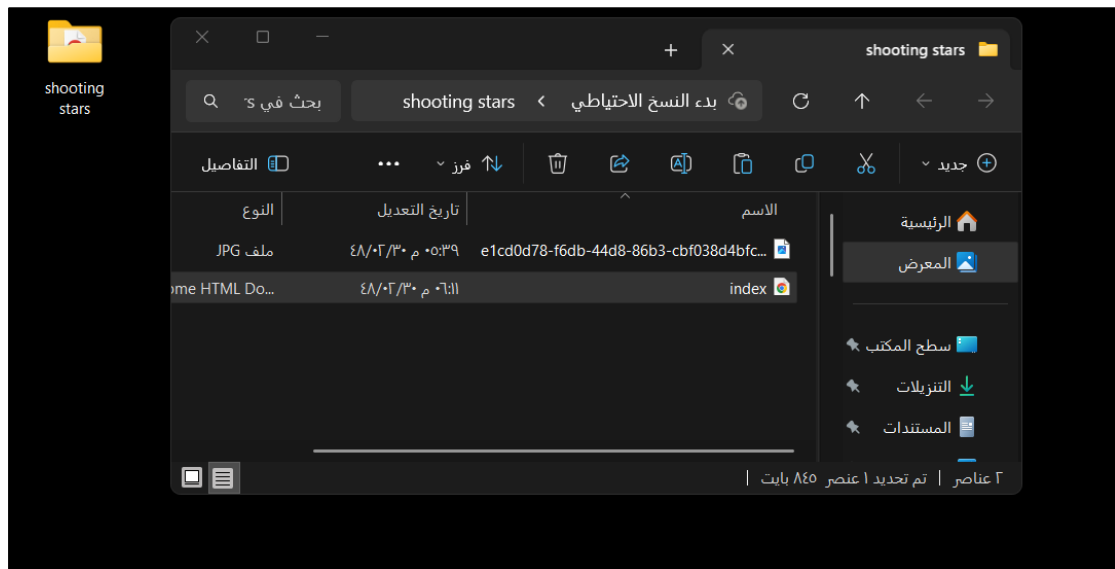

Step 24: Upload Your Website Files

Inside the htdocs folder, you can upload the files that make up your website.

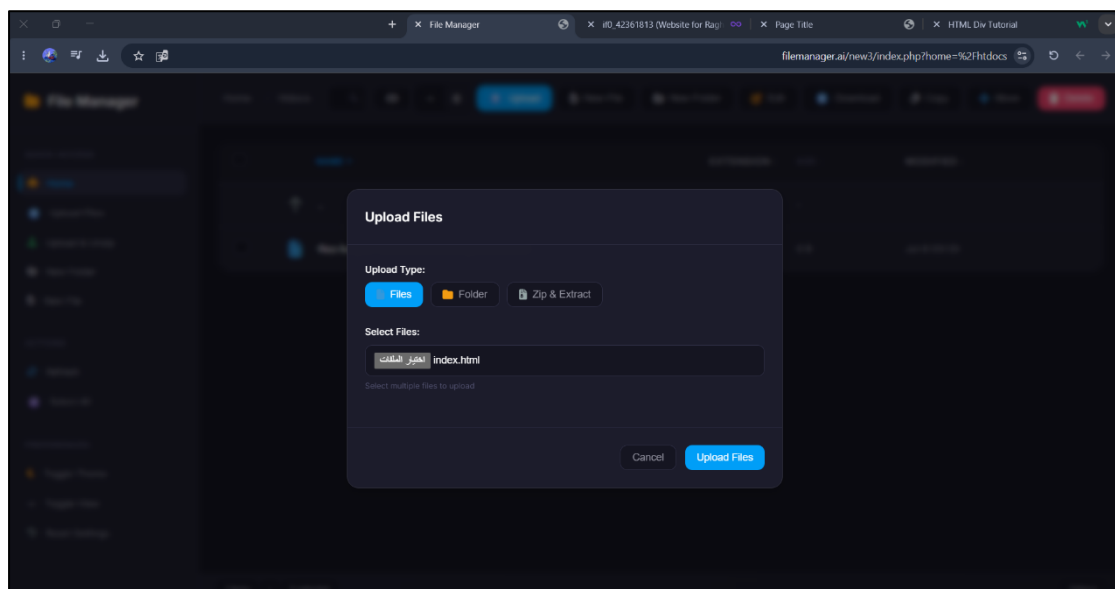

Step 25: Rename the Main HTML File

Before uploading the HTML document, make sure the main page is named: **index.html**, This is important because index.html is commonly used as the main page of a website.

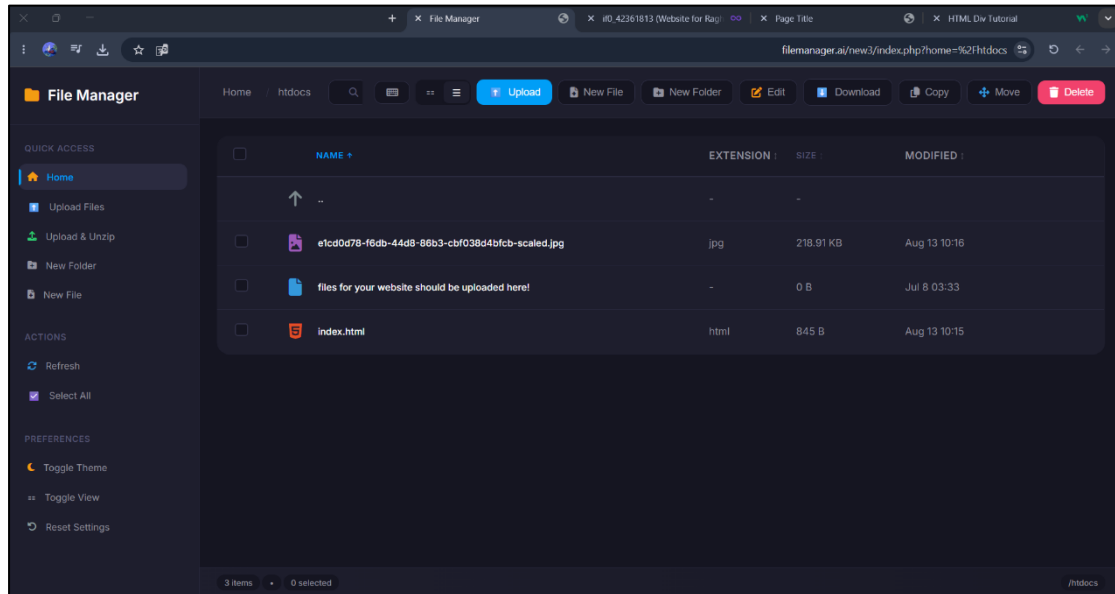

Step 26: Upload the Files

Upload your HTML file and the image you used to the httdocs folder.

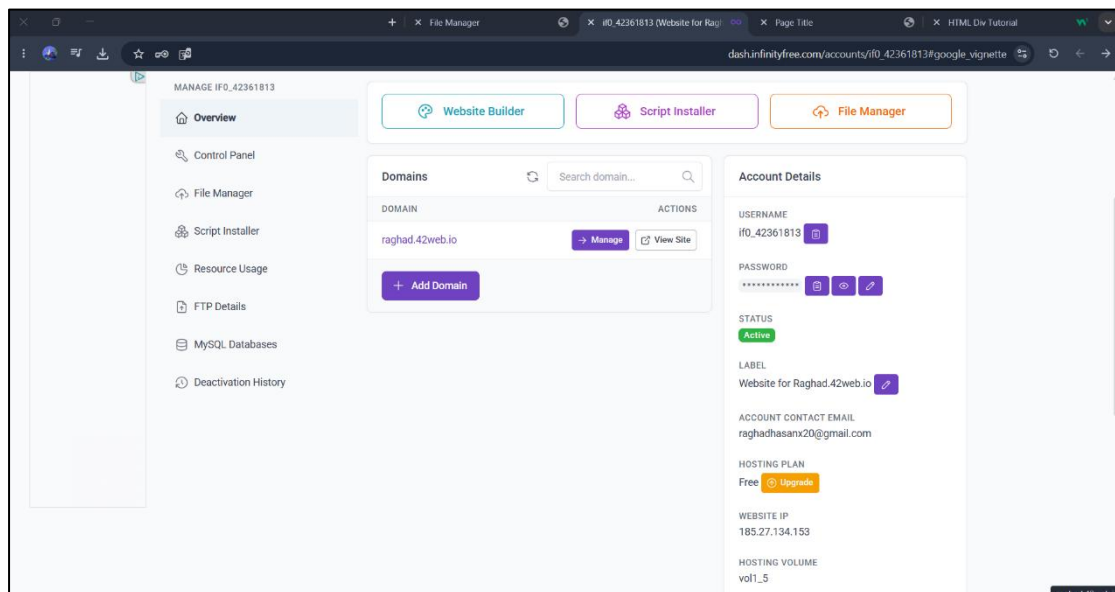

Step 27: After Uploading the Files

After uploading the files, make sure they appear correctly inside the htdocs folder.

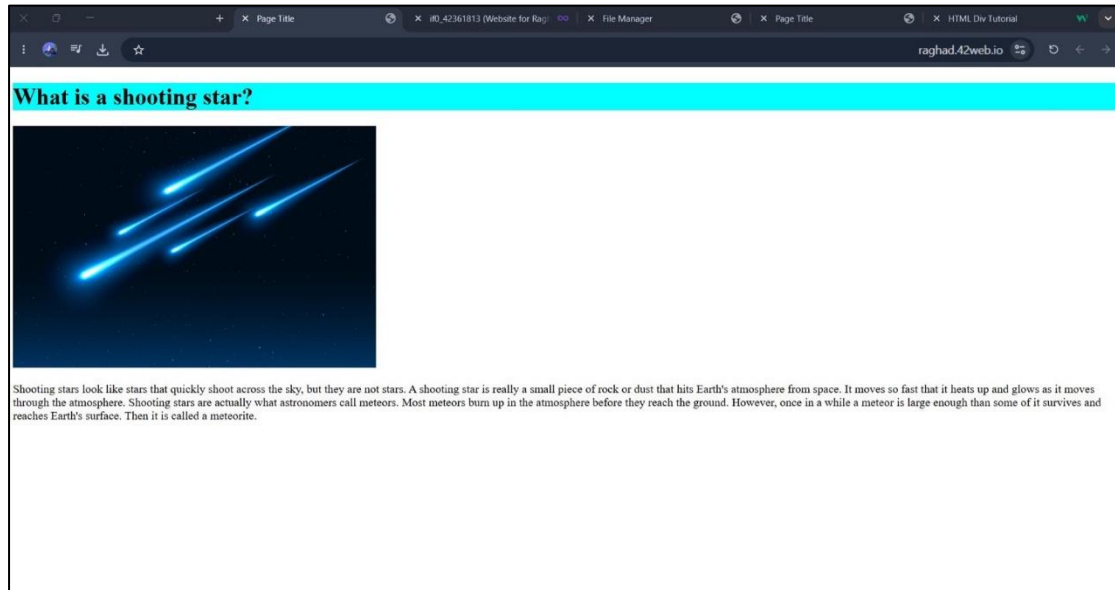

Step 28: View the Website

Go back to the previous page and click on “View Site.”

Step 29: Final Result

Finally, your website should appear online.

You have now successfully created, designed, and published a simple personal website using **HTML, W3Schools, and InfinityFree**.
